

**Guggilla Anuja– 2403A51101**

SCHOOL OF COMPUTER SCIENCE AND ARTIFICIAL INTELLIGENCE		DEPARTMENT OF COMPUTER SCIENCE ENGINEERING	
Program Name: B. Tech		Assignment Type: Lab	Academic Year:2025-2026
Course Coordinator Name STUDENT DETAILS:	Venkataramana Veeramsetty. <b>Guggilla Anuja</b> <b>2403A51101</b> <b>Batch-06.</b>		
Instructor(s) Name	Dr. V. Venkataramana (Co-Ordinator)		
	Dr. T. Sampath Kumar		
	Dr. Pramoda Patro		
	Dr. Brij Kishor Tiwari		
	Dr.J.Ravichander		
	Dr. Mohammand Ali Shaik		
	Dr. Anirodh Kumar		
	Mr. S.Naresh Kumar		
	Dr. RAJESH VELPULA		
	Mr. Kundhan Kumar		
	Ms. Ch.Rajitha		
	Mr. M Prakash		
	Mr. B.Raju		
	Intern 1 (Dharma teja)		
	Intern 2 (Sai Prasad)		
	Intern 3 (Sowmya)		
NS_2 ( Mounika)			
Course Code	24CS002PC215	Course Title	AI Assisted Coding
Year/Sem	II/I	Regulation	R24
Date and Day of Assignment	Week1 - Monday	Time(s)	
Duration	2 Hours	Applicable to Batches	24CSBTB01 To 24CSBTB39
Assignment Number: 2.1(Present assignment number)/24(Total number of assignments)			
Q.No.	Question	Expected Time to complete	
1	Lab 2: Exploring Additional AI Coding Tools – Gemini (Colab) and	Week1 - Monday	

	<p><b>Cursor AI</b></p> <p><b>Lab Objectives:</b></p> <ul style="list-style-type: none"><li>● To explore and evaluate the functionality of Google Gemini for AI-assisted coding within Google Colab.</li><li>● To understand and use Cursor AI for code generation, explanation, and refactoring.</li><li>● To compare outputs and usability between Gemini, GitHub Copilot, and Cursor AI.</li><li>● To perform code optimization and documentation using AI tools.</li></ul> <p><b>Lab Outcomes (LOs):</b></p> <p>After completing this lab, students will be able to:</p> <ul style="list-style-type: none"><li>● Generate Python code using Google Gemini in Google Colab.</li><li>● Analyze the effectiveness of code explanations and suggestions by Gemini.</li><li>● Set up and use Cursor AI for AI-powered coding assistance.</li><li>● Evaluate and refactor code using Cursor AI features.</li><li>● Compare AI tool behavior and code quality across different platforms.</li></ul>	
	<p><b>Task Description #1</b></p> <ul style="list-style-type: none"><li>● Use Google Gemini in Colab to write a Python function that reads a list of numbers and calculates the mean, minimum, and maximum values.</li></ul> <p><b>Expected Output #1</b></p> <ul style="list-style-type: none"><li>● Functional code with correct output and screenshot.</li></ul> <p>Task Description #1 ● Use Google Gemini in Colab to write a Python function that reads a list of numbers and calculates the mean, minimum, and maximum values. if is_armstrong_number(num_to_check):
    print(f"{num_to_check} is an Armstrong number.")
else:
    print(f"{num_to_check} is not an Armstrong number.")
```

153 is an Armstrong number.  
123 is not an Armstrong number.

```
def is_armstrong(number):
```

Python function that checks whether a number is an Armstrong number. Document the steps, prompts, and outputs.

Ask or edit in context

Accept Close

```
"""
Checks whether a number is an Armstrong number.

Steps:
1. Convert the number to a string to count its digits.
2. For each digit, raise it to the power of the number of digits.
3. Sum these powered digits.
4. If the sum equals the original number, it is an Armstrong number.

Prompt:
Enter a number to check if it is an Armstrong number.

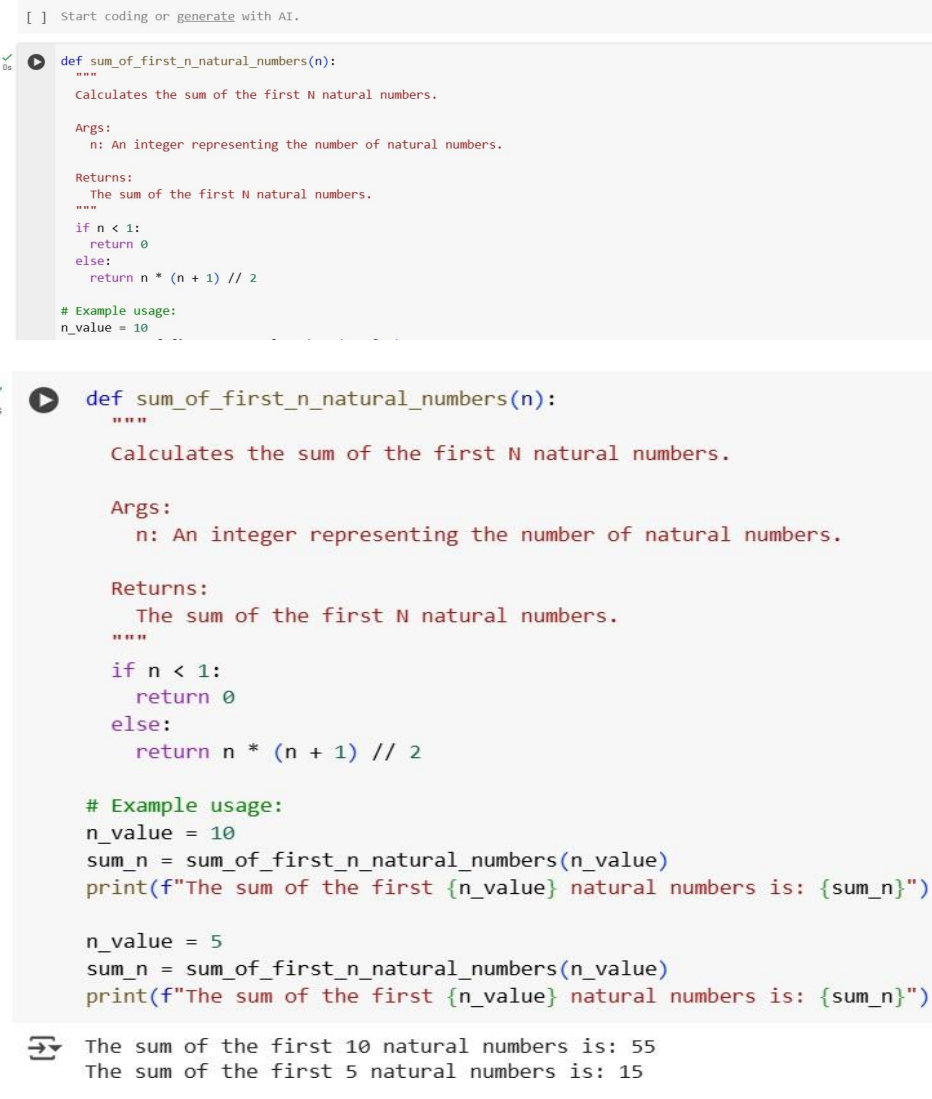

Output:
Prints whether the number is an Armstrong number or not.
"""

num_str = str(number)
num_digits = len(num_str)
sum_of_powers = sum(int(digit) ** num_digits for digit in num_str)
return sum_of_powers == number
```

Feature	Gemini Code	Copilot Code
Function Name	is_armstrong_number(number)	is_armstrong(number)
Logic Style	String conversion + for loop	Arithmetic with % and while loop
Docstring	Detailed with Args & Returns	Minimal or none
Readability	High – commented and well-structured	Moderate – more compact, sometimes no comments
Test Cases	Shown (153, 123)	Usually includes 153; others need prompting
Output Example	153 is an Armstrong number. 123 is not an Armstrong number.	Same output

Task Description #3

	<ul style="list-style-type: none"><li>• Ask Gemini to explain a Python function (e.g., is_prime(n) or is_palindrome(s)) line by line.</li><li>• Choose either a prime-checking or palindrome-checking function and document the explanation provided by Gemini.</li></ul> <p>Expected Output #3</p> <ul style="list-style-type: none"><li>• Detailed explanation with the code snippet and Gemini's response.</li></ul> <div><div>• Ask Gemini to explain a Python function (e.g., is_prime(n) or is_palindrome(s)) line by line. • Choose either a prime-checking or palindrome-checking function and document the explanation provided by Gemini.</div><div><div>Start coding or generate with AI.</div><div>[ ] Start coding or generate with AI.</div><div>Steps to check for an Armstrong number:<ol style="list-style-type: none"><li>1. - Student-written refactored code with explanations and output screenshots

Python program to calculate the sum of odd numbers and even numbers in a given tuple. • Refactor the code to improve logic and readability

```
def sum_odd_even(numbers_tuple):
    """
    Calculates the sum of odd and even numbers in a tuple.

    Args:
        numbers_tuple: A tuple of numbers (integers or floats).

    Returns:
        A dictionary containing the sum of odd numbers and the sum of even numbers.
    """
    sum_even = 0
    sum_odd = 0

    for number in numbers_tuple:
        # Check if the number is an integer before performing modulo operation
        if isinstance(number, int):
            if number % 2 == 0:
                sum_even += number
            else:
                sum_odd += number
        # You might want to handle non-integer types differently,
        # for now, we'll skip them for the odd/even check.

    return {"sum_even": sum_even, "sum_odd": sum_odd}
```

```
sum_odd += number
# You might want to handle non-integer types differently,
# for now, we'll skip them for the odd/even check.

return {"sum_even": sum_even, "sum_odd": sum_odd}

# Example usage:
my_tuple = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10)
result = sum_odd_even(my_tuple)

print(f"Original tuple: {my_tuple}")
print(f"Sum of even numbers: {result['sum_even']}")
print(f"Sum of odd numbers: {result['sum_odd']}")

my_tuple_2 = (11, 22, 33, 44, 55, 66)
result_2 = sum_odd_even(my_tuple_2)

print(f"\nOriginal tuple: {my_tuple_2}")
print(f"Sum of even numbers: {result_2['sum_even']}")
print(f"Sum of odd numbers: {result_2['sum_odd']}")
```

Original tuple: (1, 2, 3, 4, 5, 6, 7, 8, 9, 10)  
Sum of even numbers: 30  
Sum of odd numbers: 25

Original tuple: (11, 22, 33, 44, 55, 66)  
Sum of even numbers: 132  
Sum of odd numbers: 99

**Note:**

- Students must submit a single Word document including:
  - Prompts used for AI tools

- Copilot/Gemini/Cursor outputs
- Code explanations
- Screenshots of outputs and environments

**Evaluation Criteria:**

Criteria	Max Marks
Successful Use of Gemini in Colab (Task#1 & #2)	1.0
Code Explanation Accuracy (Gemini) (Task#3)	0.5
Cursor AI Setup and Usage (Task#4)	0.5
Refactoring and Improvement Analysis (Task#5)	0.5
<b>Total</b>	<b>2.5 Marks</b>
